

Stay Cool With These 4 Easy A/C Tips

1

Tip #1

Check your air filters monthly. If these get clogged, airflow gets blocked and dirt can make its way to your air conditioning unit, causing damage. Replacing filters is an easy way to increase the efficiency of your A/C and avoid costly repairs down the road.

2

Tip #2

Create shade so that your A/C unit isn't in direct sunlight. This keeps the unit cool, increasing efficiency. Also, make sure to clear debris like leaves and twigs away from the unit on a regular basis.

3

Tip #3

Use a programmable thermostat to keep your costs down and lower the wear and tear on your A/C. You can program your thermostat to let the heat rise while you're away from your house and then turn the A/C back on before you get home. You won't notice the difference (except in a lower electricity bill).

4

Tip #4

Have your unit professionally serviced on a yearly basis. This little bit of preventative maintenance helps keep your A/C running smoothly, so that small problems don't turn into costly repairs.
