

4 Ways to Help Make Your Living Room Energy-Efficient

1

If you're very forgetful, consider installing some occupancy sensors in each room. These will turn the lights on and off when someone enters and leaves the room.

2

Use lamplight to reduce the need for overhead fixtures. Not only do lamps reduce energy usage, but they also make many rooms look more attractive.

3

Consider installing linear and compact fluorescent bulbs throughout your home. These will last much longer than standard incandescent bulbs.

4

Install energy-saving power strips throughout your home, which automatically disconnect TVs, DVD players and other entertainment devices from power sources when not in use.
